Tbilisi, Georgia

2013

Selected Research

“Monetary Policy Analysis with Heterogeneous Unemployment Dynamics.”

Abstract: This paper examines the heterogeneous response of unemployment rates to unexpected expansionary monetary policy for high- and low-skilled workers using time-series analysis. I develop a New Keynesian DSGE model with asymmetric search and matching frictions, calibrated to empirical impulse responses, and find that optimal monetary policy should respond to both skill-specific unemployment and inflation due to congestion externalities in the labor market. A strong response on inflation remains optimal, while responding to output has shown to reduce overall welfare.
